

A seller owns 1,900 accounts. BobBee tells them the **three that matter today** — and drafts the outreach.

It's 7:40 AM. Tim Zhou opens BobBee. There's no dashboard to parse — just a sentence talking to him: *"Good morning. Two accounts hit renewal risk overnight and one raised a round. I've reordered your day and drafted everything. Start here."* Below it, the day's work is ranked, reasoned, and one click away.

How BobBee works, in one picture

The solution. BobBee turns a raw territory list into a ranked, cadenced, day-by-day plan of attack — **who to email and call each day of the quarter, and why** — then drafts every touch in the seller's voice. It doesn't report the day; it directs it.

Inside BobBee — from 1,900 accounts to today's three moves

Explainable ranking first. Generative drafting second.

Every ranking is inspectable — the seller can always see why an account landed where it did. watsonx sits on top of the pipeline, never underneath it.

Granite (ibm/granite-4-h-small) on watsonx.ai powers the generative layer · a deterministic fallback keeps every surface working offline.

The seller always knows what is fact and what is suggestion

● Blue means deterministic data

Rankings, scores, cadence positions and phone numbers — facts the pipeline computed and can explain.

● Purple means watsonx-generated

Briefs, drafts and suggestions are marked, so the seller separates fact from model output at a glance — trust by design.

What the seller actually receives

Email draft — Ridgeline Pharma

Enterprise Expansion · Intro email · watsonx

Hi Dana, I partner with teams like yours on IBM Cloud Paks. The short version of why I'm writing: I think we can help you move workloads off a competing platform onto IBM. I also saw that a competitor contract is up for renewal. Open to a short conversation?

Pre-call brief — Westbridge Assurance

Whitespace Nurture · Second attempt · watsonx

Primary contact: Fatima Rivera, VP of Infrastructure. Relationship active; spend flat year over year. Likely objection: existing vendor lock-in. Open with the migration-cost angle and reference their recent cloud RFP.

Productivity impact

Four hours of planning becomes forty-five minutes of doing.

Before BobBee — manual triage and drafting

~4.0 hrs

With BobBee — read brief, review, send

~0.75 hrs

Per day, per seller: about 5 minutes reading the ranked brief, 25 minutes reviewing pre-drafted emails, and 15 minutes on pre-call briefs. Frequency: **Daily**.

~16 hrs

reclaimed per seller **every week** — redirected from planning overhead into pipeline-moving work

Why it's different

Action before analytics

Most tools show the seller everything. BobBee tells them the one thing to do next, and moves the charts out of the way.

Provenance you can trust

A simple blue and purple convention makes what the system knows and what the model suggests visible at a glance.

Deterministic and generative

Explainable scoring does the ranking; watsonx writes the copy. Neither pretends to be the other.

One focused flow

Draft, send, next. Brief, dial, log, next. No context-switching across three source systems.

Roadmap

Next

Live watsonx grounding

Real ISC and install-base data feeding every brief and draft.

Then

Command-bar layer

"Log voicemail, retry Thursday" — keyboard-first, from anywhere.

Vision

Proactive plays

The system clusters the book into opportunities before the seller asks.
