

BobBee technical guide

Account intelligence and seller execution

From 1,911 accounts to the next best seller action.

Developed by

Sydney Chin / Tim Zhou / Patrick McBride

Overview

A territory book becomes a finite action system

BobBee turns fragmented account evidence into a ranked, explainable and actionable seller workflow.

1,911

accounts normalized into one book

240

accounts active this quarter

34

withheld for missing decision-maker

What the system does

01	Unify	Brings IBM position, company context, contacts and signals together.
02	Score	Creates an inspectable comparison layer across the territory.
03	Route	Assigns quarter, cadence, rank and dated sequence of touches.
04	Activate	Presents the next account, supporting evidence and ready action.

Design principle

Rank first. Explain always. Generate only where language adds value.

Guide flow

Seller problem

Prioritization is the first problem

A seller owns roughly 1,900 accounts across several systems. The scarce resource is attention, not data.

~1,900

accounts in a Select Territory book

3

source systems reconciled by hand

~4 hrs

daily triage and drafting

Common failure modes

01	Fragmented context	Spend, installs, contacts and activity are separated.
02	Uneven prioritization	The loudest account can displace the strongest evidence.
03	Planning consumes selling time	The morning is spent assembling context before action.
04	Unclear provenance	Facts and generated suggestions can look identical.

BobBee response

Convert the book into an ordered plan of work, then keep the evidence beside every decision.

Evidence

Decision engine

Seller action

System design

One intelligence chain, three responsibilities

Carbon blue marks deterministic application logic; purple identifies model-generated language.

Evidence

- 01 Territory and coverage
- 02 IBM spend and trend
- 03 Install base
- 04 Company scale
- 05 Decision-makers
- 06 Recent signals

Decision engine

- 01 Eligibility gate
- 02 Weighted score
- 03 Tier assignment
- 04 Quarter segmentation
- 05 Cadence match
- 06 Within-cadence rank

Seller experience

- 01 Priority account book
- 02 Recommended play
- 03 Daily schedule
- 04 Account detail
- 05 Pre-call brief
- 06 Ask BobBee

Control points

No decision-maker: hold the account. No model response: use a deterministic fallback. No hidden ranking step.

Account intelligence

Evidence becomes a comparable account profile

The intelligence layer normalizes commercial position, company context, momentum and activation readiness.

01	IBM position	Relationship, current and prior spend, spend trend and installed products.
02	Company context	Revenue, employee scale, industry and territory.
03	Engagement	Known contacts and verified IT decision-maker availability.
04	Momentum	Dated expansion, funding, leadership, security and risk signals.
05	Whitespace	Missing cloud, power, storage and software footprint.
06	Competitive posture	Incumbent technology and displacement opportunity.

Resulting decision flow

Portfolio shape

The active quarter is deliberately narrow

Capacity is focused without discarding future value. Every account remains visible in a named bucket.

Portfolio readout

12.6% of the book enters live cadences this quarter. 74.3% is preserved for later timing.

1,829

accounts with whitespace

510

accounts with at-risk spend

240

accounts activated now

Scoring

The score is a lens, not an oracle

Tiering creates a stable comparison before eligibility, timing, cadence fit and capacity complete the decision.

48.3

median account score

87.9

highest account score

How the score becomes work

Application view

The prioritized account book keeps evidence at the point of choice

Search, signal filters and named buckets keep the whole territory inspectable.

Figure 1. Live BobBee account book after scoring and cadence assignment.

What to notice

The seller can move from portfolio segment to account evidence without leaving the working surface.

Application view

An account explanation, not just a score

The detail view joins recommendation, IBM context, company facts, contacts, cadence and recent signals.

Figure 2. Live account-detail view for Vertex Municipal.

Provenance at a glance

Deterministic facts remain visually distinct from the generated sales angle and pre-call guidance.

Account deep dive

Vertex Municipal

Government, State/Provincial/Local / Irvine, CA / New (Active)

72.2

score / tier 1

\$21.7B

annual revenue

#8

rank in cadence

Recommended play

Displace Competitor

Lead with displace competitor; the strongest current signal is earnings financial.

Why this account

- 01 Growing IBM spend trend
- 02 10 known contacts and a decision-maker
- 03 2 recent account signals
- 04 Assigned to Targeted Outreach Cadence 3

Latest signals

- Earnings Financial Vertex Municipal reports Q4 revenue up 446% year over year
- Layoffs Restructuring Vertex Municipal restructuring to cut 17800 jobs

Portfolio opportunities

Repeatable plays emerge across the book

Play assignment turns individual evidence into a portfolio that leaders can inspect and rebalance.

Recommended plays

Largest industry books

Portfolio views reveal where coverage, capacity and sales plays are out of balance.

Activation

Capacity becomes a visible design choice

Each active cadence is capped, ranked and distributed. Overflow is retained rather than silently dropped.

240

scheduled in current-quarter cadences

217

capacity overflow retained

34

held until a contact is found

Operational contract

Every activated account has a play, cadence, rank and dated sequence of touches.

Seller workflow

Intelligence resolves into today's work

The dashboard compresses the system into a morning brief, today's emails and calls, and optional review analytics.

Figure 3. Live BobBee dashboard after the territory book is activated.

Experience principle

Action comes before analytics. Deeper detail is available, but it does not compete with the next step.

Trust and governance

Deterministic where it must be; generative where it helps

Model-generated language stays downstream from ranking, cadence assignment and scheduling.

Capability	Source	Control
Account eligibility	Deterministic	Decision-maker gate
Score and tier	Deterministic	Weighted application logic
Quarter and cadence	Deterministic	Timing, fit and capacity
Email draft	Deterministic	Contextual templates
Sales angle	watsonx.ai	Granite with deterministic fallback
Pre-call brief	watsonx.ai	Granite with deterministic fallback

Figure 4. Methodology remains available inside BobBee.

[Production path](#)

Access turns the demo into a connected seller workflow

The demo proves the workflow with local substitutes. Production value depends on approved APIs, identities and data contracts.

[Access required](#)

System	Production prerequisite	Value unlocked
watsonx.ai	Project, service credentials and approved model	Grounded summaries, briefs and drafts
Email and calendar	Delegated OAuth and application approval	Draft, schedule and send with user consent
Slack	Approved app, scopes and workspace installation	Seller alerts and collaboration context
CRM / Salesloft	API credentials and record-level permissions	Cadences, activity and outcome write-back
ISC / install base	Data-owner approval and supported interface	IBM position, footprint and whitespace
Case Viewer	Data-owner approval and supported interface	Relevant case context alongside the account
CID	Data-owner approval and supported interface	Additional internal client intelligence

[Deliberate demo boundary](#)

More enterprise software could strengthen BobBee, but each additional system adds access review, security scope and integration work. The challenge build keeps those dependencies local so the core seller workflow is easy to evaluate.

[Next action](#)

Confirm system owners, supported APIs, least-privilege scopes, data retention and approval paths before replacing any demo adapter.

Deployment

Scale access in controlled stages

Start with the developers, validate with a small seller cohort, then harden the service for organization-wide use.

01 Developer use now

3-5 builders

Run the containerized app in a protected development environment. Use synthetic or explicitly approved test data and one shared nonproduction AI project.

Gate: stable workflow, evaluation set and no secrets in source control.

02 Small pilot

10-50 sellers

Deploy a managed staging service with corporate SSO, role and territory controls, PostgreSQL, audit logs and read-only integrations first.

Gate: security review, support owner, quality targets and measured adoption.

03 Organization scale

Broad workforce

Run redundant containers on the enterprise platform, isolate environments, centralize secrets, monitor cost and quality, and add approved write actions gradually.

Gate: production SLOs, disaster recovery, governance and accountable business ownership.

Target production shape

AI strategy

Choose the model through policy, evidence and cost

Keep BobBee provider-neutral. Ranking and scheduling remain deterministic; models generate language and tool requests behind explicit controls.

PREFERRED

watsonx.ai + Granite 4 H Small

Best fit when IBM approval and project access are available. Enterprise-oriented RAG and tool use, IBM deployment alignment, governance and model choice through a gateway.

FREE PROTOTYPE

Gemini API free tier

Useful for developer experiments and small demonstrations. Rate limits apply, and free-tier content may be used to improve Google products; do not send confidential client or internal data.

PAID ALTERNATIVE

Claude API

Strong drafting and reasoning option, but Claude.ai subscriptions do not include application API usage. Treat it as a paid provider and evaluate it against the same test set.

NO API BILL

Self-hosted Granite

Open-weight deployment through Ollama or vLLM can remove per-token API charges. Hardware, operations, patching, security and availability still carry real cost.

Decision rule

Use watsonx when approved. Use a free provider only for nonconfidential prototyping. Keep a deterministic fallback and a provider adapter so model changes do not rewrite the product.

References: IBM Granite and watsonx.ai model documentation; Google Gemini API pricing; Anthropic API billing guidance. Access, terms and pricing should be rechecked before deployment.

Impact and roadmap

Reclaimed capacity creates room for better seller judgment

The near-term path secures access, validates a pilot and strengthens grounding without weakening the provenance model.

~3.25 hrs

reclaimed per seller, every day

~16 hrs

reclaimed per seller, every week

Where the time moves

From cross-system research and first-draft creation to account review, client judgment and direct engagement.

Roadmap

Next	Access and approval	Secure watsonx and application API access; confirm owners for ISC, Case Viewer and CID.
Pilot	Connected workflow	Launch read-only integrations with a small seller cohort and measure quality, trust and time saved.
Scale	Governed action	Add approved write actions, proactive plays and organization-wide operations.

Built with

watsonx.ai / Granite / watsonx Assistant / Flask / Python / IBM Carbon / IBM Plex

Developed by Sydney Chin, Tim Zhou, and Patrick McBride

Source note: the demo uses deterministic synthetic account data and local representations of external systems.
